(By Prof. Crofton.)--Give a geometrical method of drawing normals to a parabola from a point on the curve. I. Solution by Professor Minohik. When three normals meet in a point, the chord joining the feet of two makes the same angle with the axis as that made by the line joining the vertex to the foot of the third. Now it is easy to show that, when the point of meeting is on the curve, the chord joining the feet of the two normals passes through a fixed point on the axis at a distance from the vertex equal to the semi-latus-rectum. Hence the construction is, --join the given point on the curve to the vertex, and from the point on the axis distant from the vertex by the length of the semi-latus-rectum draw a line making with the axis the same angle as that made by the line first drawn. We then get the feet of the two required normals. II. Solution by R. F. Davis, Nilkanta Sarkar, and others. The following...
